ADHEE VENAYAC.K.V	19BCS0046

Under the Guidance of

Dr.Lawanyashree

Vellore Institute of Technology

(Deemed to be University under section 3 of UGC Act, 1956)

School of Information Technology & Engineering

December 2021

1. PROBLEM STATEMENT :

Library Management System is an application which refers to library systems which are

generally small or medium in size. It is used by librarian to manage the library using acomputerized system where he/she can add new books, videos and Page sources.

Books and student maintenance modules are also included in this system which would keeptrack of the students using the library and also a detailed description about the books a librarycontains. With this computerized system there will be no loss of book record or member recordwhich generally happens when a non computerized system is used.

All these modules are able to help librarian to manage the library with more convenience and ina more efficient way as compared to library systems which are not computerized.

Libraries are used to store books, but require a system tonavigate to a specific book or specific content within a book.A library database system is an infrastructure that allows usersto search books and book content, add/remove, and download

selected books.

The problem faced is that library users require an efficientmethod to find a specific book or keyword(s) within a bookgiven a continuously expanding library. Efficiency requires thatthe processing time should stay relatively the same even as the

library contents increases

2. PROJECT DESCRIPTION :

A college library management is a project that manages and stores books information electronically according to students needs. The system helps both students and library manager to keep a constant track of all the books available in the library. It allows both the admin and the student to search for the desired book. It becomes necessary for colleges to keep a continuous check on the books issued and returned and even calculate fine. This task if carried out manually will be tedious and includes chances of mistakes. These errors are avoided by allowing the system to keep track of information such as issue date, last date to return the book and even fine information and thus there is no need to keep manual track of this information which thereby avoids chances of mistakes.Thus this system reduces manual work to a great extent allows smooth flow of library activities by removing chances of errors in the details.

Library Management System is an application which alludes to library frameworks which are for the most part little or medium in size. It is utilized by bookkeeper to deal with the library utilizing a modernized framework where he/she can add new books, recordings and Page sources. Books and understudy upkeep modules are likewise remembered for this framework which would keep track of the understudies utilizing the library and furthermore an itemized depiction about the books a library contains. With this modernized framework there will be no deficiency of book record or part record which for the most part happens when a non automated framework is utilized. This large number of modules can assist bookkeeper to deal with the library with more accommodation and in a more effective way when contrasted with library frameworks which are not modernized.

3.SERVICE PROVIDER

About Service Provider:

A service provider is an individual or entity that provides services to another party. The provision of services between a service provider and a company is typically governed by a service agreement.

Examples of potential service providers for a company are advisors, individual consultants, law firms, design shops and investment banks.

About PAAS:

platform as a service (PaaS) is a cloud computing model where a third-party provider delivers hardware and software tools to users over the internet. Usually, these tools are needed for application development. A PaaS provider hosts the hardware and software on its own infrastructure. As a result, PaaS frees developers from having to install in-house hardware and software to develop or run a new application.

PaaS tools tend to be touted as simple to use and convenient. Users will normally have to pay on a per-use basis. An organization may find the move to a PaaS compelling considering potential cost savings over using on-premises alternatives.

DESCRIPTION ABOUT SERVICE PROVIDER

AWS:

Amazon Elastic Compute Cloud (Amazon EC2) is a web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers. Amazon EC2's simple web service interface allows you to obtain and configure capacity with minimal friction. It provides you with complete control of your computing resources and lets you run on Amazon's proven computing environment.

Amazon EC2 offers the broadest and deepest compute platform with choice of processor, storage, networking, operating system, and purchase model. We offer the fastest processors in the cloud and we are the only cloud with 400 Gbps ethernet networking. We have the most powerful GPU instances for machine learning training and graphics workloads, as well as the lowest cost-per-inference instances in the cloud. More SAP, HPC, Machine Learning, and Windows workloads run on AWS than any other cloud. Click here to learn What's New with Amazon EC2.

CHARACTERSTICS OF AWS:

Reliable, scalable, infrastructure on demand

Increase or decrease capacity within minutes, not hours or days

SLA commitment of 99.99% availability for each Amazon EC2 region.

Each region consists of at least 3 availability zones

The AWS Region/AZ model has been recognized by Gartner as the recommended approach for running enterprise applications that require high availability
