Course: DATA Structures.

Digital  
Assignment → 3

- 1) Write a menu driven program to implement a queue data structure using linked list considering following options in the menu.
- a. Create an empty queue
  - b. Returns queue size
  - c. Enqueue an elements in the queue
  - d. Delete an element in the queue
  - e. Displaying the queue elements.
  - f. Returns the front element of queue.

```
#include <stdio.h>
#include <stdlib.h>
#include <conio.h>
#define capacity 5
int count = 0;
void create();
void append();
void deleteQueue();
void display();

struct node
{
    int data;
    struct node *next;
}
struct node *head;
struct node *newnode;
struct node *temp;

int main()
{
    int x;
```

```
Printy("Queue Program  
using linkedlist");
```

```
int q=1;
```

```
do  
{
```

```
Printy("In 1) create insert an empty  
Queue");
```

```
Printy("In 2) DELETE first  
elements in queue");
```

```
Printy("In 3) ENQUEUE an  
Element in the queue");
```

```
Printy("In 4) Return queue  
size");
```

```
Printy("In 5) Display  
the queue elements");
```

```
Printy("In 6) Returns the front  
elements of queue");
```

```
int choice;
```

```
Scanf("%d", &choice);
```

```
Switch (choice)
```

```

Nithish G

In a vertical parking lot, totally 5 cars are parked one after the other from one end where the other end is a dead end. If the person who has parked first wants to come out, what kind of ADT he has to follow. Write a C code to implement the above scenario.

```
#include <stdio.h>
#include <stdlib.h>
#include <conio.h>
#define capacity 5

int stack[capacity];

int top = -1;

void push(int element);
int pop();
void peek();
void display();
```

```
int main()
```

```
{  
    int ch, info;
```

```
    while(1)
```

```
{  
    Printf("Vertical Car Parking Max 5 cars \n");
```

```
    Printf("1. PARK Car \n");
```

```
    Printf("2. Remove Car \n");
```

```
    Printf("3. Top most car \n");
```

```
    Printf("4. Display CARS \n");
```

```
    Printf("5. Size \n");
```

```
    Printf("6. Exit \n");
```

```
    Printf("Enter choice:");
```

```
    Scanf("%d", &ch);
```

```
    switch(ch)
```

```
    {  
        switch(ch)
```

```
        {
```

```
            case 1:
```

```
                Printf("Enter the Car Number to Park:");
```

```
                Scanf("%d", &info);
```

```
                Push Push(info);
```

```
                break;
```

case 2:

```
info = pop();
```

```
Printf("Car Number = %d\n", info);
```

```
break;
```

case 3:

```
Peek();
```

```
break;
```

case 4:

```
display;
```

```
break;
```

case 5:

```
Printf("No. of cars parked: %d\n", topt);
```

```
break;
```

case 6:

```
Printf("Exiting. \n");
```

```
exit(0);
```

```
break;
```

default:

```
Printf("Invalid choice, please try again. \n");
```

```
} Printf("\n\n");  
return 0;
```

```
}
```

void Push(int element);

{ if (~~top > size~~;

if (top >= capacity - 1)

{ Printy("Parking slot Full...\n");

};  
else {

top++;

stack[top] = element;

Printy("Car Parked...\n"); }

}

int POP()

{ if (top < 0)

{ Printy("No cars Parked, \n");

return 0;

return stack[top--]; }

void Peak()

{ if (top < 0)

{ Printy("\n No cars Parked.");

};

else { Printy("\n The top car is: %d", stack[top]); }

```
void display()
```

```
{ int i;
```

```
  if (top < 0)
```

```
  { Printy("N o cars Parked");
```

```
  }
```

```
  else
```

```
  { Printy("The cars Parked from top to Bottom");
```

```
    for (i = top; i >= 0; i--)
```

```
    { Printy("_\n%.d\n_ \n", stack[i]);
```

```
    }
```

```
  }
```

```
}
```
